Re: *Weekly Update for Advanced Oxidation Water Treatment Plant*
WSB Project No. 2170-29

Last week, the contractor finished installing the window panels, and is in the process of replacing the booster pumps that provide pressures to a high elevation area of the City along with the sprinkler system in the peroxide room. The electrician is continuing to install the cables associated with the AOP units. The City selected paint colors this week for the process piping and floor of the new building; the colors will match those in the existing Granular Activated Carbon portion of the water treatment plant.
