

Lead / Copper Tap Water Monitoring Saint Anthony Village Results 2025

Ninety percent of homes tested had a result less than (or equal to) 1 ppb for lead and 880 ppb for copper. **These results indicate that our system has not exceeded the lead action level and has not exceeded the copper action level.**

The following definitions will be helpful regarding the information provided above:

90th Percentile Level – This is the value obtained after disregarding 10 percent of the samples taken that had the highest levels. (For example, in a situation in which 10 samples were taken, the 90th percentile level is determined by disregarding the highest result, which represents 10 percent of the samples.)

Note: In situations in which only 5 samples are taken, the average of the two with the highest levels is taken to determine the 90th percentile level.

Action Level – The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. The action level for lead is 15 ppb. The action level for copper is 1,300 ppb

Maximum Contaminant Level Goal (MCLG) – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety. Because there is no safe level of lead, the MCLG for lead is zero. The MCLG for copper is 1,300 ppb.
